

What are "Additional Specs"?

Last Modified on 17/03/2023 10:03 am EDT

Search for different formulations, additives, purification methods, etc.

When you're working with sensitive experiments, variations in purification, additives, or storage, and general formulation may affect the design and execution of your experiment. The **Additional Specs** filter allows you to find antibodies based on preparation and treatment. For example, you can select for products that have been *lyophilized*, contain *azide* or other preservatives, or are explicitly *azide-*, *preservative-*, or *BSA-free*, and more. Like with the **Company** filter, you can also exclude entries from your search results.

When you select multiple options from **Additional Specs**, the products you are shown will satisfy **all** of them (e.g. *BSA-free* AND *affinity purified*)!

Please check out our [Guide to Filters for Antibodies](#) in Selector to learn more about our filters!
