

Searching for an antibody to use in multiple experimental techniques

Last Modified on 17/03/2023 9:59 am EDT

If you need an antibody that's suitable for more than one experiment, you can search for antibody compatibility across multiple experimental applications in the same search

For example, you can open the **Application** filter and select *Western Blot* and *Immunoprecipitation*.

The product results will show products that are associated with both techniques, and the figures results will include figures where those products have been used in western blot and/or immunoprecipitation.

You can read more about this filter [here](#) and the search logic we use on the platform [here](#). Please check out our [Guide to Filters for Antibodies](#) to learn more about our filters!
