

Locating sequence information for protein reagents

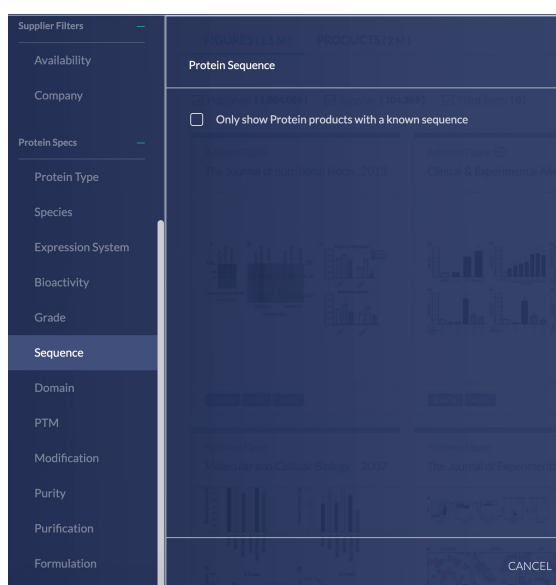

Last Modified on 17/03/2023 10:26 am EDT

Protein amino acid sequence information is listed when available — you can also filter for products with a sequence

Sequence information about the different protein reagent products found on Selector comes from our relationships with vendors. When available, we display the (primary) amino acid sequence of the protein or domain—for example, if the protein you are seeking is only a cytosolic c-terminal domain of the native form (read about [filtering by domain here](#)), then the given sequence will correspond to that segment of the protein instead of the full-length protein.

Under the *Protein Specs* list of filters, you can toggle the **Sequence** filter to limit your search results to only those with sequence information.

Please check out our [**Guide to Filters for Protein Reagents**](#) to learn more about our filters!
