

Q3 2024: What's new in Selector

Last Modified on 27/01/2025 3:16 pm EST

We are excited to announce new enhancements in the platform between July and September 2024

Over the past three months, we have added data from over **1.3M publications**, **1.6M experimental use cases**, and **468K reagents**.

1. Protocol insights are now available in Selector

To aid scientists in selecting the best reagents for their experimental needs, we have expanded our technology offering to surface protocol insights with reagents in Selector. This empowers scientists to identify conditions that have been used previously for a reagent. Method details are derived from both published experiments and vendor recommendations and can be found on the Product Page or the Figure Results pertaining to the reagent. Please note that access to these features and enhancements depends on what is available at your organization.
